"Identification of a new family of human epithelial protein kinases containing two leucine/isoleucine-zipper domains.";

Eur. J. Biochem. 213:701-710(1993).

-: TISSUB SPECIFICITY: EXPRESSED IN EPITHELIAL TUMOR CELL LINES OF COLONIC. BREAKT AND DESOPHAGEAL, ORIGIN.

-: SIMILARITY: BELONGS TO THE SER/THR FAMILY OF PROTEIN KINASES.

MAP KINASE KINASE KINASE SUBFAMILY.

    similarity).
    TISSUE SPECIFICITY: Highly expressed in brain and kidney.
    FTM. Autophosphorylated on Ser/Thr. Phosphorylated in cytosol under basal conditions and dephosphorylated when membrane-associated (By similarity).
    SIMILARITY: BELONGS TO THE SER/THR FAMILY OF PROTEIN KINASES.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            CATALYTIC ACTIVITY: ATP + a protein = ADP + a phosphoprotein.

-!- PUNCTION: ESSENTIAL FOR SPORE DIFFERENTIATION.

-!- CATALYTIC ACTIVITY: ATP + a protein tyrosine = ADP + protein tyrosine phosphate.

-!- DEVELOPMENTAL STAGE: EXPRESSED THROUGHOUT DEVELOPMENT WITH A PEAK DEVING THE MOUND STAGE OF MORPHOGENESIS.

-!- SIMILARITY: BELONGS TO THE TYR FAMILY OF PROTEIN KINASES.

-!- SIMILARITY: CONTAINS 1 SAM DOMAIN.

-!- SUBUNIT: LIGATION OF CD2, TCR OR CD28 INDUCES ACTIVATION AND TYROSINE PHOSPHORYLATION OF ITK.

-!- SUBCELLULAR LOCATION: LOCALIZES TO CELL SURFACE RECEPTORS IN THE PLASMA MEMBRANE AFTEN STIMULATION WITH RESPECTIVE RECEPTORS (TCR, CD28, CD2) IN T-CELLS.

-!- TISSUE SPECIFICITY: IS DETECTED IN THE THYMUS, LYMPH NODE AND VERY FAINTLY IN THE SPLEEN, BUT IS NOT DETECTED IN THE LIVER, LUNG, KIDNEY, HEART, BRAIN, INTESTINE OR TESTIS: EXPRESSED IN T-LYMPHOCYTES AND MAST CELLS. IT MAY ALSO BE EXPRESSED IN NATURAL KILLER CELLS.

a T-cell-specific tyrosine kinase gene inducible by interleukin
                                                                                                Heyeck S.D., Berg L.J.; "Developmental regulation of a murine T-cell-specific tyrosine kinase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      DEVELOPMENTAL STAGE: IS PRESENT IN THE FETAL THYMUS AS EARLY AS DAY 14 OF GESTATION. THE LEVELS ARE 5- TO 10-FOLD HIGHER IN THYMOCYTES THAN IN PERIPHERAL T CELLS, AND INCREASE IN THE THYMUS DURING DEVELOPMENT FROM NEONATE TO ADULT.

INDUCTION: BY INTERLEUKIN-2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          MEDLINE=20040393; PubMed=10570288; Ching K.A., Kawakami Y., Kawakami T., Tsoukas C.D.; Ching K.A., Kawakami Y., Kawakami T., Tsoukas C.D.; Emc/Itk associates with activated TCR complexes: role of the plecketrin homology domain."; J. Immunol. 163:6006-6013(1999).
-!- FUNCTION: MAY PLAY A ROLE IN T-CELL DEVELOPMENT, POTENTIALLY IN THYMIC SELECTION.
-!- CATALYTIC ACTIVITY: ATP + a protein tyrosine = ADP + protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                            MEDLINE=95023908; PubMed=7524075; August A., Gibson S., Kawakami Y., Kawakami T., Mills G.B., Dupont Angust A., Gibson S., Kawakami Y., Kawakami T., Mills G.B., Dupont "CD28 is associated with and induces the immediate tyrosine phosphorylation and activation of the Tec family kinase ITK/EMT in the human Jurkat leukemic T-cell line."; Proc.  Clone distribution: MGC clone distribution information can be four through the I.M.A.G.E. Consortium/LLNL at: http://image.llnl.gov Series: IRAK Plate: 22 Row: i Column: 18 This clone was selected for full length sequencing because it passed the following selection criteria: matched mRNA gi: 4507360.
 cDNA Library Preparation: Life Technologies, Inc. CDNA Library Arrayed by: The I.M.A.G.E. Consortium (LLNL) DNA Sequencing Group at the Stanford Human Center, Stanford University School of Medicine, Stanford,
 Submitted (03-DEC-2001) Nati
Gene Collection (MGC), Cance
Institute, 31 Center Drive,
 Email: cgapbs-r@mail.nih.gov
Tissue Procurement: ATCC

Clone distribution: MGC clone distribution information can be for through the I.M.A.G.E. Consortium/LINI at: http://image.llni.gov Series: IRAK Plate: 9 Row: h Column: 9
This clone was selected for full length sequencing because it passed the following selection criteria: Hexamer frequency ORF analysis, GenomeScan gene prediction, Similarity but not identity

 by the finished sequence as soon as it is available and the accession number will be preserved.

1 12654: contig of 12654 bp in length
12655 12754: gap of 100 bp
12755 13487: contig of 733 bp in length
13488 13587: gap of 100 bp
13588 14337: contig of 750 bp in length
 is believed to be correct as given, however the sizes of the gaps between them are based on estimates that have provided by the submittor.

This sequence will be replaced
 NOTE: This is a 'working draft' sequence. It currently consists of 5 contigs. Gaps between the contigs are represented as runs of N. The order of the pieces

 sequence clones from Drosophila Gene Collection 1 (Rubin et al., Science 2000). The sequence has been subjected to integrity checks for sequence accuracy, presence of a polyA tail and contiguity within 100 kb in the genome. Thus we believe the sequence to reflect accurately this particular cDNA clone. However, there are artifacts associated with the generation of cDNA clones that may have not been detected in our initial analyses such as internal priming, priming from contaminating genomic DNA, retained introns due to reverse transcription of unspliced precursor RNAs, and reverse transcriptase errors that result in single base changes. For further information about this sequence, including its location and relationship to other sequences, please visit our Web site (http://fruitfly.berkeley.edu) or send email to

 The invention provides a method for identifying or screening a nuclear factor kappa B (NF-kB) activation inhibitor by examining the effect of a test substance on modulating the function(s) of TGF-beta activated kinase 1 (TAKI). The NFKB activation inhibitors targeting on TAKI can be used to treat or prevent autoimmune diseases (e.g. chronic rheumatoid arthritis), intractable diseases with inflammation (such as atrophic dermatitis and psoriasis), viral infection, endotoxin shock, septicemia and others. The present sequence represents the nucleotide sequence of human TAKIC (hTAKIC) protein.

 the binding of TAK1 polypeptide to TAB1 polypeptide. The method to comprises: (a) contacting the polypeptide in the presence of a sample; and (b) detecting the amount of bound polypeptide, in which the sample; and (b) detecting the amount of bound polypeptide first. The transforming growth factor (TGF)-beta inhibitory substances can be used in drugs for indications e.g. as TGF-beta signal transmission inhibitors or activators, or extracellular matrix protein production enhancement inhibitors or activators, or cell proliferation prevention inhibitors or activators, or cell proliferation prevention inhibitors or activators, or municosuppression inhibitors or activators, or activators, or activators, or activators, or activators, or activators, or immunosuppression inhibitors or activators, or activators or activators, or precipitation inhibitors or activators, or anyloid beta protein precipitation inhibitors or activators, and such substances can also be inhibitors of the TAK1 polypeptide function, particularly kinase activators.

 TAK-1
 The present sequence encodes human transforming growth factor-beta (TGF-beta) activated kinase, TAK-1. The DNA is used to produce the TAK-1 protein which is involved in the TGF-beta family signal transmission system. TAK-1, also known as activator of MAPK kinase (AMK-1), is an enzyme which is activated by TGF-beta and bone morphogenetic protein (BMP) and activates MAPK kinase by phosphorylation.

 CC A method has been developed for screening for substances which inhibit CC the binding of TAKI polypeptide to TAMI polypeptide. The method CC comprises: (a) contacting the polypeptide in the presence of a sample; CC and (b) detecting the amount of bound polypeptide, in which the sample (CC and be pre-mixed with TAKI or TAMI polypeptide first. The transforming CC growth factor (TGF)-beta inhibitory substances can be used in drugs for indications e.g. as TGF-beta signal transmission inhibitors or CC indications or activators, or cell proliferation prevention inhibitors or activators, or compress in production enhancement CC inhibitors or activators, or monocyte migration inhibitors or activators, or compression inhibitors or activators, or inhibitors or activators, or inhibitors or activators, or inhibitors or activators, or inhibitors or activators, or anyloid beta protein precipitation inhibitors or activators, or anyloid beta protein compression inhibitors or activators, or anyloid beta protein precipitation inhibitors or activators, and such substances can also be considered the control of the TAKI polypeptide function, particularly kinase cc activity. The present sequence encodes human TAKI.

The present invention describes a method for screening compounds for inhibition of inflammatory cytokine signal transduction by contacting the sample with TAK1 and its receptor TAB1 and selecting for inhibition of TAK1/TAB1 binding. Also described is a method for screening compounds for inhibition of inflammatory cytokine signal transduction in which the inhibition of TAK1 phosphorylation is selected for; and drug compositions for the treatment of inflammatory disorders containing as active component an inflammatory cytokine signal transduction inhibitor. TAK1 is an essential component of the signalling process which results in release of inflammatory cytokines such as interleukin. (IL-1), inflammatory cytokines such as interleukin. (IL-1), for the selection of effective antiinflammatory agents. The present for the selection of effective antiinflammatory agents. The present

The invention relates to identifying pain-regulating substances (A) comprises (i) incubating a test substance with a cell (or preparation from it) that has synthesised a peptide or protein (B) and (ii) measuring either binding of the test substance to (B) or some functional parameter that is altered by this binding. The method is useful for identifying pain-regulating substances (A) with analyssic activity. (A) along with nucleic acid (ABL88411-ABL88441) that encode proteins (B, ABB85006-ABB85037) that interact with (A); (B); vectors containing the nucleic acid; antibodies against (B); cells that express (B) and agents that bind to (B), are all useful for treating pain, particularly chronic pain, including use in gene therapy. The same materials can also be used for diagnosis, e.g. of neurological and neurodegenerative diseases. The present sequence is that of a polynucleotide of the invention.
 Identifying pain-regulating compounds, useful for treating chronic pain and for diagnosis, by measuring binding of compounds to specific peptides and proteins -

The invention provides a method for identifying or screening a nuclear factor kappa B (NF-kB) activation inhibitor by examining the effect of a test substance on modulating the function(s) of TGF-beta activated kinase [TAKI). The NFkB activation inhibitors targeting on TAKI can be used to treat or prevent autoimmune diseases (e.g. chronic rheumatoid arthritis), intractable diseases with inflammation (such as atrophic dermatitis and psoriasis), viral infection, endotoxin shock, septicemia and others. The present sequence represents the nucleotide sequence of human TAKIa

 TAK-1
 The present sequence encodes mouse transforming growth factor-beta (TGF-beta) activated kinase, TAK-1. The DNA is used to produce the TAK-1 protein which is involved in the TGF-beta family signal transmission system. TAK-1, also known as activator of MAPK Kinase (AMK-1), is an enzyme which is activated by TGF-beta and bone morphogenetic protein (BMP) and activates MAPK kinase by phosphorylation.

 capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABJ30511), expressed DNA
 Sequence 3367
 The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from at ftp.wipo.int/pub/published_pct_sequences.

The present invention describes a method (M1) for screening for an anti-neoplastic agent. The method involves exposing cells to a chemical agent to be tested for anti-neoplastic activity, determining a change in expression of at least one gene (I) of a signature gene set, where (I) comprises a sequence (S) selected from 8447 sequences (given in ABL61664 to ABL70110), or is at least 95% identical to (S), where a change in expression is indicative of anti-neoplastic activity. (I) has cytostatic activity and can be used in gene therapy. M1 can be used for screening an anti-neoplastic agent, and can be used for producing a product which

 expression by rectifying mutations or deletions in a patient's genome that affect the activity of PKIN by expressing inactive proteins or to supplement the patients own production of PKIN pKIN nucleic acids may be used to produce the PKIN polypeptide, by inserting the nucleic acids into a host cell and culturing the cell to express the protein. PKIN nucleic acid and its complementary sequences may also be used as DNA probes in diagnostic assays to detect and quantitate the presence of similar nucleic acid sequences in samples and therefore which patients may be in need of restorative therapy. The present sequence is human PKIN-9

```
encoding such proteins. PKIN sequences of the invention are useful for diagnosing, treating or preventing disorders associated with aberrant expression of PKIN, particularly immune system disorders (e.g. acquired immune deficiency syndrome (AIDS), thymic hypoplasia, Crohn's disease, anaemia, asthma), neurological disorders (e.g. epilepsy, Charcot-Marie-Tooth disease or seizures), cell proliferative disorders (e.g. cancers such as adenocarcinoma, leukaemia, lymphoma, melanoma, myeloma, sarcoma, and developmental disorders (e.g. Down's syndrome). They are also used encoding human PKIN-12 protein.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

| Nesult No. 1                                                               |                                                                                                | ΟΣ<br>* 3 a p p                        | Length 1062 1062 1062 1062 1064 1054 1054 1054 1054 1054 1054 1054 105                                                                                                                           |                       | ID<br>BM554120<br>AL555128<br>B1696710<br>AL550689<br>BM62610<br>AL520975<br>BQ219348<br>BM226610<br>AL520975<br>BG02988<br>BG02988<br>BG03883<br>BJ062988<br>BG073486<br>BF780258<br>BI062988<br>BG173486<br>BG173488<br>AN960377<br>BI7776993<br>BG173488<br>BG173488<br>BG173488<br>BG173488<br>BG173488<br>BG173488<br>BG173488<br>BG173488<br>BG173488<br>BG173488<br>BG173510<br>BG182182<br>BG182182<br>BG182182<br>BG182182<br>BG182182<br>BG193512<br>AL710196<br>BE291363<br>BE291363                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | Description  BMS54120 AGENCOURT  ALS52728 ALS55728  B1996710 603347214  ALS50589 AL550589;  B0019348 AGENCOURT  BM426610 pgf2n.pkc  AL520975 AL520975  B0067693 AGENCOURT  BM726610 pgf2n.pkc  AL520975 AL520975  B00773883 BJ073883  BJ073883 BJ073883  BJ773883 BJ073883  BJ773893 BJ073883  BJ773893 AV398933  BJ767913 603061057  AV398935 AV398935  BM771969 BEC5645  BM71267 BEC5289  BJ014293 BJ014293  BG65449 GC25289  BJ016787 BJ036129  AL73651 AL773651  BJ016787 BJ0162289  BJ016787 BJ016787  BJ016787 BJ016797

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

 The invention provides a method for identifying or screening a nuclear factor kappa B (NF-kB) activation inhibitor by examining the effect of a test substance on modulating the function(s) of TGF-beta activated kinase (TAKI). The NFkB activation inhibitors targeting on TAKI can be used to treat or prevent autoimmune diseases (e.g. chronic rheumatoid arthritis),

A method has been developed for screening for substances which inhibit the binding of TAK1 polypeptide to TAB1 polypeptide. The method comprises: (a) contacting the polypeptide in the presence of a sample; and (b) detecting the amount of bound polypeptide, in which the sample can be pre-mixed with TAK1 or TAB1 polypeptide first. The transforming growth factor (TGF) beta inhibitory substances can be used in drugs for indications e.g. as TGF-beta signal transmission inhibitors or activators, or extracellular matrix protein production enhancement inhibitors or activators, or activators, or cell proliferation prevention inhibitors or activators, or monocyte migration inhibitors or activators, or

The present sequence represents human TAK1.
 Sequence
 The present invention describes a method for screening compounds for inhibition of inflammatory cytokine signal transduction by contacting the sample with TAKI and its receptor TABI and selecting for inhibition of TAKI/TABI binding. Also described is a method for screening compounds for inhibition of inflammatory cytokine signal transduction in which the

 compositions for the treatment of inflammatory disorders containing as active component an inflammatory cytokine signal transduction inhibitor. TAKI is an essential component of the signalling process which results in release of inflammatory cytokines such as interleukin-1 (IL-1), IL-10, tumour necrosis factor (TNF) and IL-6. The methods can be used for the selection of effective antiinflammatory agents. The present sequence represents human TAK-1, which is used in the exemplification of
 Sequence
The invention relates to identifying pain-regulating substances (A) comprises (i) incubating a test substance with a cell (or preparation from it) that has synthesised a peptide or protein (B) and (ii) measure either binding of the test substance to (B) or some functional paramet that is altered by this binding. The method is useful for identifying

 The invention provides a method for identifying or screening a nuclear factor kappa B (NF-kB) activation inhibitor by examining the effect of a test substance on modulating the function(s) of TGF-beta activated kinase (TAK1). The NFkB activation inhibitors targeting on TAK1 can be used to treat or prevent autoimmune diseases (e.g. chronic rheumatoid arthritis), intractable diseases with inflammation (such as atrophic dermatitis and psoriasis), viral infection, endotoxin shock, septicemia and others.  4
 Protein identification; signal transduction pathway; metabolic pathway; hybridisation assay; genetic mapping; gene expression control; promoter; termination sequence.
 The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
